# Informatica Action Pack

**Key Capabilities**

- Orchestrate Informatica Powercenter as part of bigger application release and deployment processes

- Built-in Automic actions for working with Informatica:

- Automate domains, Repositories, Integration Services, Repository services and the Administration Console

- Actions for automating work with the different PowerCenter client tools:

## Release Automation for Informatica PowerCenter

### Challenge

As more and more of our core business applications and legacy systems go through a digital transformation and acquire more agile capabilities the need for data management across systems at a higher, on-demand pace and in the context of a release process increases. for example, some of Automic's Continuous Delivery for Siebel customers rely on Informatica PowerCenter to integrate and manage critical data flowing in and out of their different Siebel systems. But having to wait for a business analyst or an administrator to run different data aggregations and transformations needed as part of the process breaks the agility goal. Data is a critical component of not only BI and business level reporting. In fact it is just as critical for many development and test stages within the application lifecycle. For example, testing often requires certain types and amounts of data which is not readily available from production and needs to be transformed, aggregated and loaded into the test database before certain tests can begin to run. As organizations build out their automated deployment pipelines the need to automate data integration and processing as part of these new pipelines also becomes critical.

### About The New Action Pack

Automic's Informatica Powercenter action pack adds an out of the box integration point to Informatica and lets users include creation, execution and rollback of Informatica interactions as an integral part of the Application Release Automation model. A new section of built-in actions is introduced and supports the automation of sophisticated workflows that automate working with PowerCenter. Once modeled-in, These workflows are an integral part of an application deployment process and increase the agility of your entire development-test and release process. Adding this action pack to your release automation environment will also ensure that any Informatica activity as part of a deployment or even stand alone is always available for monitoring and all outputs are kept in context for debugging and compliance needs.

### About Automic Release Automation

Automic has the most flexible yet scalable Release Automation product on the market and is environment agnostic, making Automic uniquely positioned for help to transform any enterprise for the digital age.
